Project Title: Lockheed SR-71 Blackbird

The Blackbird represents the epitome of American engineering and technological excellence while also embodying the secretive nature of military projects. I would like this website to have a few simple pages, each dedicated to an aspect of the Blackbird. I believe it would be best to dedicate a home page to the general overview of the aircraft describing its purpose, features, and lifespan. While the division of content is mostly up to you, the designer, I would suggest breaking reading material and media into short description pages, like in the [NASA informational pages](#). I think there is a lot of content on this Wikipedia page which may be redundant and/or can be combined into page sections.

- **Home Page/Introduction** – Introduce the symbolic nature of the Blackbird along with a brief overview of the aircraft and specifications.
- **Development** – The factors that led the United States Department of Defense and Lockheed's to develop a new reconnaissance aircraft and how the Blackbird got its name.
- **Design** – This section details the purpose for the design and critical design components that meet the prescribed goals. The subsections under the Design section include the technological innovations in design specifications, material acquisition, and construction.
- **Operational History** – This section discusses the lifespan and historic usage of the legendary reconnaissance plane, including records broken, variants, accidents, and aircraft disposition.
- **Legacy** – This section should discuss the lasting impact the Blackbird had on the world and successors to its mission.
- **Foot Notes** – This section should cite the Wikipedia page and media on the Blackbird.
